//note="Vector: pBluescript SK(-); Site_l: EcoRI; Site_2:
XhoI; Tissue supplied by Christian Bachem and Richard
Visser (Department of Plant Breeding, Wageningen
University, The Netherlands). The cSTA libraries will
attempt to capture the induction and initiation/initial
growth of the tuber in an in vitro system as described in
Bachem et al. (Plant Journal, 1996). Small microtubers
Gevelop from axillary buds attached to stem explants when
placed on a high sucrose medium (10%). Visible
morphological changes occur synchronously at day five in
the axillary buds. The first library, cSTA (1-20) consists
of axillary buds harvested on days 1-3. This targets
those genes involved in induction of the microtubers. The
following libraries, cSTA (21-40) and cSTA (41-60),
capture genes involved in tuber initiation and outgrowth.
This library is noted as P3 in Tanksley lab notebooks."

Xhol; This library targets genes expressed in dormant
tubers. This library was made from sections of dormant
tuber, avoiding the buds and epidermis. Tubers were stored
for one month post-harvest at 4oC. The tuber was peeled,
well away from the surface. Then it was chopped into 1-2
mm cubes and immediately frozen in liquid nitrogen. This
library is noted as P4 in Tanksley lab notebooks."

/note="vector: pBluescript SK(-); Site_1: EcoRI; Site_2: XhoI: This library targets genes expressed in dormant tubers. This library was made from sections of dormant tuber, avoiding the buds and epidermis. Tubers were stored for one month post-harvest at 4oC. The tuber was peeled, well away from the surface. Then it was chopped into 1-2 mm cubes and immediately frozen in liquid nitrogen. This library is noted as P4 in Tankshey lab notebooks."

/note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2:
Xhoi; This library targets genes expressed in dormant
tubers. This library was made from sections of dormant
tubers, avoiding the buds and epidermis. Tubers were stored
for one month post-harvest at 4cC. The tuber was peeled,
well away from the surface. Then it was chopped into 1-2
mm cubes and immediately frozen in liquid nitrogen. This
library is noted as P4 in Tanksley lab notebooks."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1196 ggtgatgtgcgtattcagtacagagaccaactagactttgaagatatcgctcgacagttt 1255

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                     **SIDSS/gcgdata/geneseqn-emb1/NA1982.DAT;**

This invention describes novel plant N-acetylglucosaminyl transferase I (GNTI) proteins and their encoding nucleic acids. The nucleic acid sequences of the invention may be used for recombinant production of the encoded proteins, which are then used to raise antibodies (Ab) for identifying plants with deficient or defective production of the protein. They may also be used to detect such plants by hybridization and to solate related sequences from other plants or to generate antisense or sense constructs for reducing/deleting GNTI protein activity in plants. These transgenic plants may be used to produce glycoproteins with minmal, uniform and defined sugar residues. Such glycoproteins are useful in medicine and research, e.g., human glucocerebrosidase for treating Gaucher's disease. Plants which are defective or deficient in production of the GNTI protein can be made to produce glycoproteins with these plants eliminates the need for the difficult isolation and these plants eliminates the need for the difficult isolation and caping or preparation in defective animal plant N-acetylglucosaminyl transferase I plants producing glycosylated proteins of cells. This sequence represents potato (Solanum German 37pp; Nucleic acid encoding useful for generating antigenicity 16-18; P-PSDB; AAY08888 Page ., Claim

This invention describes novel plant N-acetylglucosaminyl transferase I (GnTI) proteins and their encoding nucleic acids. The nucleic acid sequences of the invention may be used for recombinant production of the encoded proteins, which are then used to raise antibodies (Ab) for identifying plants with deficient or defective production of the protein. They may also be used to detect such plants by hybridization and to isolate related sequences from other plants or to generate antisense or sense constructs for reducing/deleting GnTI protein activity in plants. These transgenic plants may be used to produce glycoproteins with minimal, uniform and defined sugar residues. Such glycoproteins are useful in medicine and research, e.g. human glucocerebrosidase for treating Gaucher's disease. Plants which are defective or deficient in production of the GnTI protein can be made to produce glycoproteins with minimal, uniform and defined sugar residues, of low antigenicity. Use of these plants eliminates the need for the difficult isolation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                             deglycoslyation of native proteins or preparation in defective animal cells. This sequence represents cDNA which encodes an Arabidopsis

                                                                                     Rabbit liver GnT I was purified and digested with pepsin, then trypsin. The peptide fragments were sequenced and used to design degenerate PCR primers (see AAG01220-5). CDNA was prepared from total RNA from rabbit liver. PCR was carried out on the CDNA preparation. One of the two PCR products was cloned into the Smal site of pGEM72 for sequencing and then used as a riboprobe. The riboprobe was used to screen a rabbit liver CDNA library in lambda gt10. The largest insert in a positive clone was 1.6kb. An 80bp riboprobe was prepared from the 5'-terminal of the 1.6kb insert and used to pGEM-7z to obtain pGEM-7z-regntl. The full-length rabbit GnT I colding sequence was eventually obtained from overlapping clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           caatttattcgcccagaagtttgcagaacgtacaattttggtgagcatggttctagtttg 1015

Preparation of maltose-binding protein-N-acetylglucosaminyltransferase for use in sugar chain synthesis, comprises using Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the preparation of a maltose-binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (MBP)-N-acetylglucosaminyltransferase (GnT) fused protein. The method comprises transforming Escherichia coli with an expression vector encoding the fusion protein. GnT antibody is useful in sugar chain synthesis and in a plasmid pMAL-C2/EcoRT.XbaI fragment to give a new plasmid pMGNT-1. The present sequence encodes human GnT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tactacaagattgcacgtcattacaagtgggcattggatcagctgtttcacaagcataat 661
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           781
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            835

                           A rabbit GnT I cDNA probe was prepared using PCR on rabbit liver cDNA. The probe was used to screen an amplified human genomic DNA library in lambda EMBL3 prepared from chromosomal DNA of chronic myeloid leukaemia cells. The coding sequence was located in a 4.0kb fragment of human genomic DNA by screening with a probe containing the entire coding region of the rabbit GnT I cDNA. The fragment was sequenced and found to contain an ORF coding for a protein of 445 amino acids (2 less than the rabbit enzyme). The similarity between the human and rabbit enzyme coding sequences is 85%.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gggcagttctttgaccagcacctcaagtttatcaagctgaaccagcagtttgtgcacttc

This invention relates to nucleic acid sequences AAF93744 - AAF93916

which encode human secretory or membrane proteins represented by

AAB881317 - AAB8819. Included in the invention are primers

AAF83917 - AAF94295 and AAF62232 - AAF62235 which are used to isolate the

CDNA sequences of the invention. The invention also includes methods for

the production of antibodies directed against the proteins, and cDNA

sequences, which can be used in vaccines. The polynucleotide sequences

can be used in gene therapy. The polynucleotide sequences

can be used in gene therapy. The polynucleotide sequences

can be used associated with inappropriate secretory

proteins they encode may be used in the prevention, treatment and

diagnosis of diseases associated with inappropriate secretory

proteins may also be used as DNA probes in diagnostic assays

complymentate protein expression. The nucleic acids and complementary

sequences may also be used as DNA probes in diagnostic assays

complymentation reactions (PCR) to detect and quantitate the

presence of similar nucleic acid sequences in samples. They may also be

considered to study the expression and function of secretory proteins/membrane

considerity modulators (agonists and antagonists) of expression and

dentify modulators (agonists and antagonists) of expression and

considered to down regulate expression and activity. The antibodies and antagonists may also be used as therapeutic

dentity to down regulate expression and activity. The antibodies may also

considered to accompany of the protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid
                                                                                                                                                                                   cDNA encoding a membrane or secretory protein clone PSEC0120.
                                                                                                                                                                                                                                        Human; secretory protein; membrane protein; vaccine; gene therapy; rheumatoid arthritis; diabetes; ss.

                                   isolated nucleic acid detection reagent for detecting 1000 or more as from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ARCHARCA (ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to immunogenic portions of new human breast tumour antigens (AAB28183-B28214) and their coding sequences (AAC69645-C69804). The breast tumour antigen polypeptides of the prese invention and their coding sequences are useful for inhibiting the development of breast cancer in a patient. The breast tumour antigen polypeptides and polypentices may be used in vaccines and pharmaceutical compositions for treating breast cancer, and for diagnosing and monitoring the cancer. The present sequence is a coding sequence for the immunogenic portion for one such human breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins

the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a sequence complementary to a joint comprises a 3'-end sequence, where the complementary to a joint sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the containing of the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs appriatised methods. AAH013628 and AAH03638 and AAH03638 represent human annho acid sequences; and AAH13629 to AAH13632 chaps and annho acid sequences; and AAH13629 to AAH13632 chaps and allow obtains the exemplification and a second of the contains and annho acid sequences and a semplification and a second of the contains and a second of the exemplification and a second of the contains and a second of the exemplification and a second of the contains and a second of the exemplification and a second of the contains and and a second of the contains and a second o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2;

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous landing and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and constructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1435
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1495
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           849
